# WORKSHEET TWO

# SAVING OUR PLANET FROM FASHION WASTE

Fast fashion has a huge impact on the environment. In this episode, we learned that the fashion industry is responsible for 10% of the world's greenhouse gas emissions. It also contributes to water pollution, fills up landfills with waste, and even releases tiny plastic particles called microplastics into the water.

## Did you know?

When Fionn Ferreira was just 18 years old, he invented a magnet-based method to remove microplastics from water!

## Now it's your turn!

Can you think of any other big ideas to solve the environmental problems caused by the fashion industry? For example, you might invent:

- A new way to reduce landfill waste from clothing.
- A method for removing harmful dyes from the water used in fashion production.

## Your Challenge:

Think of a creative and exciting solution to one of these problems, or any other environmental issue caused by fashion. Be as imaginative as you like!
