WORKSHEET ONE

SUSTAINABLE

TRANSPORT

CUTTING DOWN ON GREENHOUSE GASES

Sustainable transport means travelling in ways that are better for the environment. This includes cycling, scooting, walking, using electric cars, or taking public transport (like buses and trains). By using sustainable transport, we can help protect the planet while still allowing people and goods to move around.

In this episode, we learned that vehicles like planes, trains, buses, cars, and boats are big contributors to global warming. We saw some creative solutions such as solar powered boats, drone taxis, and cycle paths that are lit up with solar powered rocks!

Now it's your turn

Can you come up with another creative and exciting way to transport people or goods sustainably? Think about how you could use clean energy like the sun, wind, or even waste products to power your invention.

For example:

- Demi and Kate came up with a hover-scooter that could be powered by food waste
